Wireless Security Guide
(for Windows XP, Windows Vista, Windows 7, Mac Osx)
(NF1ADV)
Wireless Security Guide

This guide will take you through the process of configuring, changing or checking the wireless security settings on an existing wireless network.

This guide **will not** assist you to setup a new wireless network. Please refer to the wireless setup document for your model available from the support section of the NetComm* or Dynalink** website.

Any changes to your wireless security settings will require you to reconfigure wirelessly connected devices to use the new security settings. Please ensure that you have your wireless setup guide handy for this.

Step 1: Selecting a wireless security type:

There are a number of different types of wireless security to select from.

Before changing your settings, check the types of security available on your modem/router and then consult your wireless adapter manufacturer to ensure your wireless adapter is compatible with your chosen security type.

The most commonly used security types are:

- WEP (64bit or 128bit)
- WPA (Radius)
- WPA-PSK
- WPA2 (Radius)
- WPA2-PSK

The majority of wireless adapters should support one (or all) of the above security types.

You will be unable to utilise Radius server authentication without having a Radius server in place and configured on your network.

Step 2: Selecting a wireless security key:

Once you have chosen which wireless security type you want to use on your network, you will then need to create your wireless security key or wireless password.

Depending on the security type you choose, you will have the option of using either an ASCII or HEX format key.

ASCII refers to any letter or number you can see on your keyboard.

HEX refers to the letters A to F and the numbers 0 to 9.

You will need to ensure that your security key is the correct length. Your modem/router will display the required number of characters (letters and/or numbers) you need.

The default WEP key for most NetComm products is: a1b2c3d4e5
Step 3: Setting up your wireless security:

Please ensure that your modem/router is connected to your computer using an ethernet cable before continuing.

1. Open your web browser and navigate to the site http://192.168.1.1

![Image]

2. Use "admin" (without the quotes) for the username and "admin" (without the quotes) for the password. Click OK to login.

3. Click on WIFI and select Security.

![Image]

4. Ensure Enable WPS is set to Disabled.

5. Your SSID (Name of the wireless network) will be displayed in this screen.

6. For this example we will use WPA-PSK for the Network Authentication.
   If you would like to select a different network security type instead, click the drop down menu in the "Network Authentication" section and select the desired security type.

7. In the WAP/WAPI passphrase field, you will see the default network key.

8. Click on Click here to display, to see your current network key.

9. You may change this if desired, please make a note of the changed network key as this will be used to connect to your network in a later step.

10. Click Apply/Save to allow changes to take effect.

Any changes to your wireless security settings will require you to reconfigure any wirelessly connected devices to use the new security settings. You will now need to re-setup any wirelessly connected computers with the new wireless security key. Please ensure that you have your wireless setup guide handy for this.
