NP207 – Having interferences that drops the speed or connection

Please be informed that you might having some issues on your powerline networks, they can be as follow:

1. Too much electrical devices that are being used at the same time in your environment.
2. The power points that are being used are on different phase of electrical circuit board.
3. You may having EMI (Electromagnetic Interference) and/or RFI (Radio Frequency Interference), you may want to use a powerboard with EMI/RFI certification to reduce this kind of interferences.
