System Log Setup
(3G29Wn)
System Log

The system log provides a way to check for problems or provide more information about your issue when requested by Technical Support.

There are varying levels of information available to be displayed, however, this guide will only take you through the process of enabling “debug” mode. This means the maximum amount of information possible will be displayed.

As this information is cleared when the modem / router / VOIP ATA reboots, we recommend using a “Syslog Utility” (for example: Kiwi Syslog).

This software is able to receive the log information from the modem and save it. *

* - If supported by your model of modem / router.
System Log

This guide will take you through the steps required to enable your system log.

1. Navigate to http://192.168.1.1 in a web browser using "admin" (no quotes) as both the username and password.

2. Mouse over the "Status" menu and select the "System Log" option.

3. Set "Log" to "Enable".
4. Set "Display Level:" to "Debugging" from the pull down menu.

If you do not want to have your logging information sent to another computer, you can now click "Apply".

Once the page refreshes, you will then be able to click "View System Log" and see the current system log information.

To enable remote logging, please continue to the next page.
## Enabling Remote System Logging

1. Set “Mode:” to either “Remote” or “Both”. *(both enables you to also view the system log as per the instructions above)*

---

**System Log -- Configuration**

If the log mode is enabled, the system will begin to log all the selected events. For the Log Level, all events above or equal to the selected level will be logged. For the Display Level, all logged events above or equal to the selected level will be displayed. If the selected mode is ‘Remote’ or ‘Both,’ events will be sent to the specified IP address and UDP port of the remote syslog server. If the selected mode is ‘Local’ or ‘Both,’ events will be recorded in the local memory.

Select the desired values and click ‘Apply/Save’ to configure the system log options.

<table>
<thead>
<tr>
<th>Log:</th>
<th>Disable</th>
<th>Enable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log Level:</td>
<td>Debugging</td>
<td></td>
</tr>
<tr>
<td>Display Level:</td>
<td>Debugging</td>
<td></td>
</tr>
<tr>
<td>Mode:</td>
<td>Both</td>
<td></td>
</tr>
<tr>
<td>Server IP Address:</td>
<td>0.0.0.0</td>
<td></td>
</tr>
<tr>
<td>Server UDP Port:</td>
<td>514</td>
<td></td>
</tr>
</tbody>
</table>

Apply/Save
2. Enter the **Server IP address** of the computer you are running your Syslog Utility software on. You cannot leave this field set to the default of 0.0.0.0.

3. Click “**Apply/Save**”.

Your Syslog Utility software should now be able receive logging information from your modem / router / VOIP ATA.

For assistance with configuring the Syslog Utility software, please contact the software manufacturers.
